Ora2Pg overview

Ora2Pg is a free open-source tool used to migrate an Oracle database to a PostgreSQL compatible schema.

It connects to the Oracle database, scans it automatically and extracts its structure or data, then generates SQL scripts that you can load into PostgreSQL.

The migration assessment report estimates the effort required in person-days by scoring every database object that needs manual rewriting. Stored procedures and packages written in PL/SQL usually need the most attention because many Oracle built-in functions have no direct equivalent.
